

ABSTRACT

A detachable adaptor for glasses by which shelter glasses are detachably mounted immediately in front of main glasses.

5 The main glasses include a main frame which holds a pair of main lenses, and the shelter glasses include a shelter frame which has magnetic lockers at both ends thereof and holds a pair of shelter lenses. The detachable adaptor has first and second clamp legs to clamp the adaptor to a desired position

10 of the main frame. The first and second clamp legs are jointed at centers thereof to each other by a hinge. The detachable adaptor further has a magnet unit provided at a rear end of the first clamp leg and an adjusting screw provided at a rear end of the second clamp leg. The adjusting

15 screw has a role as a spacer to adjust a clamping force of the first and second clamp legs when clamping the adaptor to the desired position of the main frame. Therefore, the detachable adaptor for glasses of the present invention is mounted to a desired position of the main glasses and selectively changes

20 magnetic poles of a magnet unit provided therein, so that a variety of shelter glasses are selectively attached to the main frame of the main glasses by use of the detachable adaptor.
